

Twitter Relay Bot Brief

Updated: 18/11/2020 22:00

Twitter account A is private. Twitter Account B, which we own, follows Twitter Account A. Twitter Account B scrapes continuously for new tweets from Twitter Account A. When a new tweet is posted on Twitter account A the text is copied through the API connection on Twitter Account B and the text and emojis are pasted in a tweet on Twitter Account C at a customisable delay of X second(s).

Ideally, there would be a config document through which we can customise this delay. Also, the bot is to run via command line interface (not browser emulation).
